MONITORING AMPLIFIER MODEL RM - 10

TECHNICAL SUMMARY

Electrical Characteristics:

Input Impedance (unloaded transformer input)..... 50, 200 or 500 Ohms
by changing transformer taps

Bridging Input Impedance..... 10,000 Ohms, using either 35 db fixed
plug-in H-pad or remote volume control

Output Load Impedance..... 5/8/15/500/600 Ohms

Power Output (with less than 2% distortion)..... 10 Watts

Overall Gain (from 500 Ohm source to 15 Ohm load)..... 102 db

Frequency Response..... ±1.5 db 30-15000 Cycles

Noise Level (for 10 Watt output, 95 db gain)..... -62 db

Power Supply..... 115 Volts 50/60 Cycles

Power Consumption..... 75 Watts

Tube Complement:

2..... 6J7 Metal

1..... 6SN7GT

2..... 6L6G

1..... 5U4G

Mechanical Specifications:

Panel (for mounting in standard relay rack)..... 19" x 10 $\frac{1}{2}$ "

Finish..... Raytheon Woodland Brown (Black on special orders)

Weight (net)..... 35 lbs.

DESCRIPTION

Uses. The Model RM-10 Monitoring Amplifier is a high fidelity, high gain, 10 watt amplifier suitable for monitoring, audition, recording and talk-back applications. In emergencies it may be used as a program line amplifier. It makes an ideal amplifier for use in a transcription playback booth because of its high gain, low distortion and excellent frequency characteristics. These same features make it an excellent amplifier for recording purposes.

Construction. The unit requires 10 $\frac{1}{2}$ inches of panel space in a standard rack or cabinet. The amplifier and power supply are mounted on the same chassis and a dust cover encloses them. All parts are mounted so that the amplifier may readily be serviced without removal from the rack. All electrolytic condensers are of the plug-in type. Tubes and electrolytic condensers may be removed from the front through the door in the panel. Removal of the dust cover exposes the wiring so that resistors and other components may be serviced from the rear of the unit.

Circuit. The RM-10 is a four stage amplifier consisting of a 6J7 pentode stage, a 6J7 triode, a 6SN7GT balanced phase inverter and a 6L6G push-pull output stage. Feedback is used around the phase inverter and output stage to reduce distortion and noise.

Electrical Characteristics. The frequency response is substantially flat from 30 to 15000 cycles, assuring proper monitoring of all types of programs. At 5 watts output the harmonic distortion is less than 0.6 of 1 per cent, while at 10 watts it is approximately 1.2 per cent from 50 to 10,000 cycles and less than 2 per cent at 15000 cycles.

Controls & Connections. Gain adjustment is provided through the use of an interstage variable control on the front panel. A fixed 35 db plug-in H-pad of 10,000/500 ohms impedance is normally furnished with the unit for use on the input circuit. If remote control is desired a unit may be constructed from parts furnished by Raytheon to plug in place of this fixed pad.

Various input and output connections are located on terminal board TB-1 and are as follows:

<u>TERMINALS</u>	<u>CONNECTION</u>
1 & 2	Low Level Direct Input .
3 & 4	Bridging Input
5	Ground
9 & 10	500/600 Ohms Output
7 & 8	15 Ohm Output
7 & 9	8 Ohm Output
7 & 6	5 Ohm Output
7	CT on 500 Ohms Output

Terminals 1 & 2 are for low level inputs not exceeding -40 db. The input on the Bridging terminals should not exceed 0 db.

OPERATION

Operation of the unit is simple. The only controls requiring adjustment are the gain control and remote volume control where one is used. If the remote control is used the gain control on the unit should be set at the desired level and the volume may then be controlled from the remote point.

MAINTENANCE

The RM-10 should provide trouble-free service over long periods of time with little or no special attention. When replacements are required they may be identified by referring to the parts list, chassis photographs and circuit diagram.

Tubes. The tubes in this unit may all be tested in a standard tube checker. It is advisable to check the tubes at frequent intervals so that faulty ones can be replaced.

Voltage Measurements. A table of tube socket voltages is shown below. The d-c voltages are measured from the tube socket contacts to ground, the a-c filament voltages are measured between filament contacts.

TUBE VOLTAGES

Voltages read with respect to ground (except filament voltage); 20,000 ohms/volt voltmeter. 115 volts applied to power transformer primary. No signal input.

SYMBOL NUMBER	TYPE	FUNCTION	E _f	E _k	E _{sg}	E _p	E _p
V-1	6J7	1st a-f amp.	6.3	1.8	70	85
